Map Projections for Smaller Areas

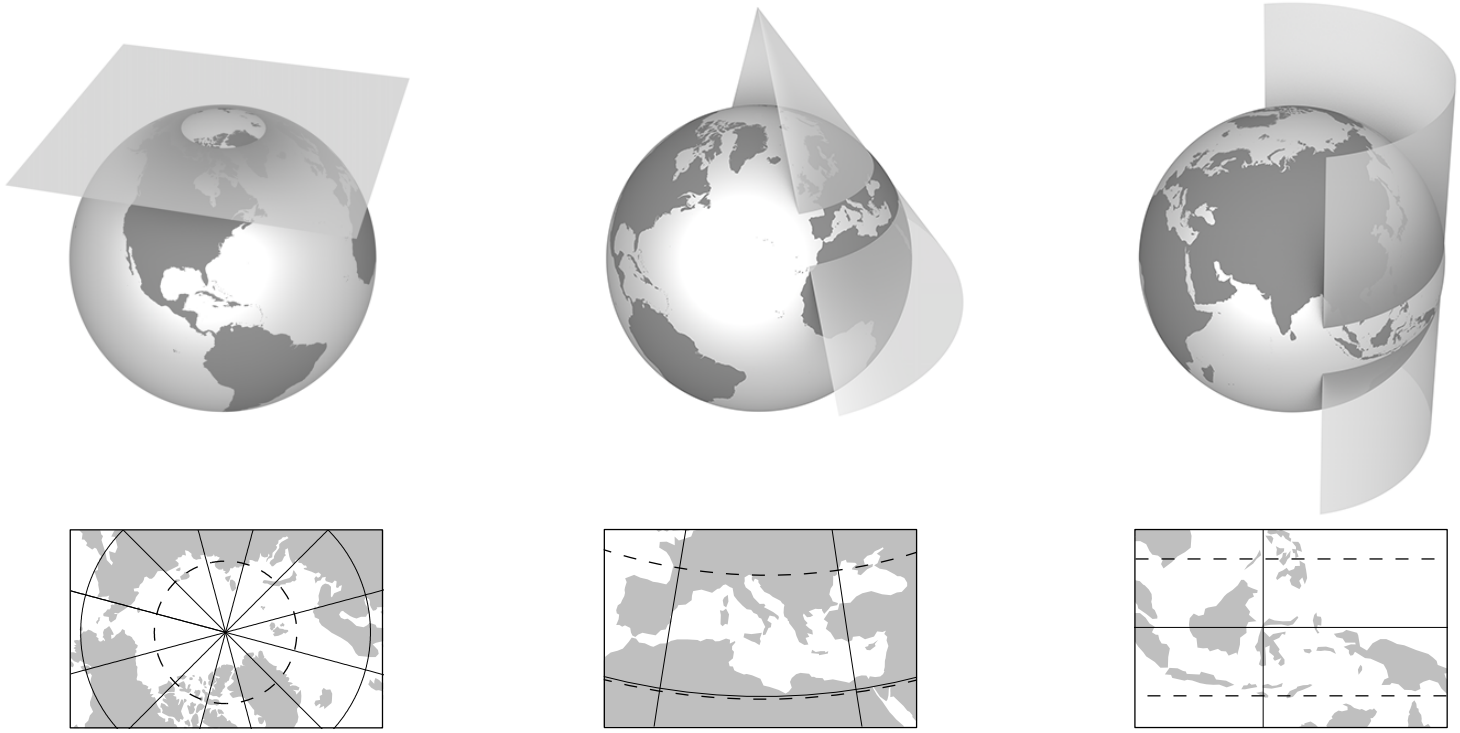

Azimuthal, Conic and Cylindrical Projections for Smaller Areas

MONASH University

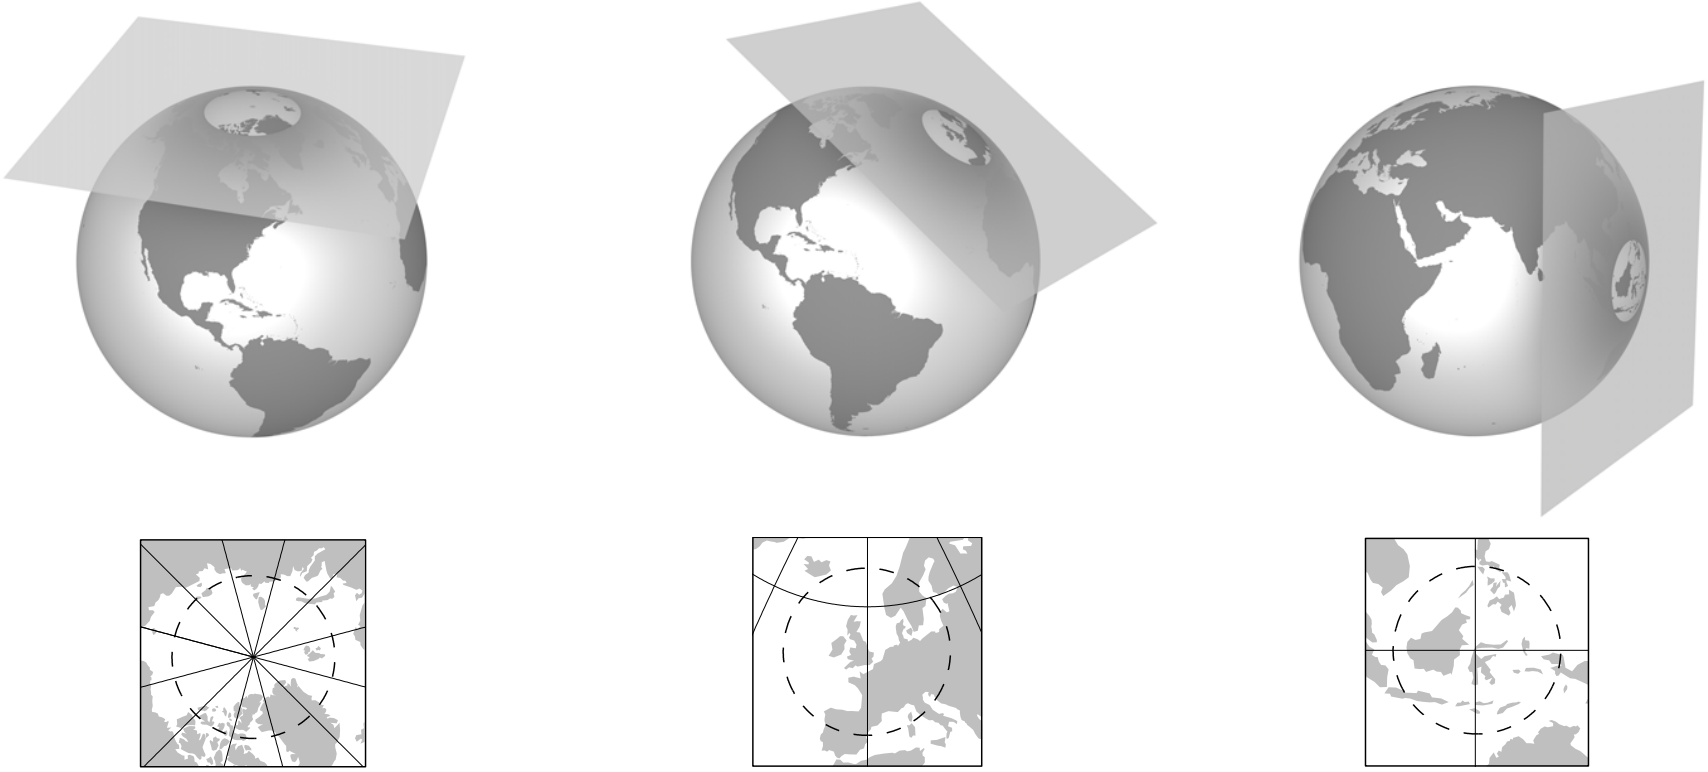

When maps use a **landscape format**, select a projection where the projective surface is close to the sphere. This minimises distortion of the map.

Poles: azimuthal (straight meridians and concentric parallels)
Intermediate latitudes: conic (straight meridians, circular parallels)
Equator: cylindrical (straight meridians and straight parallels)

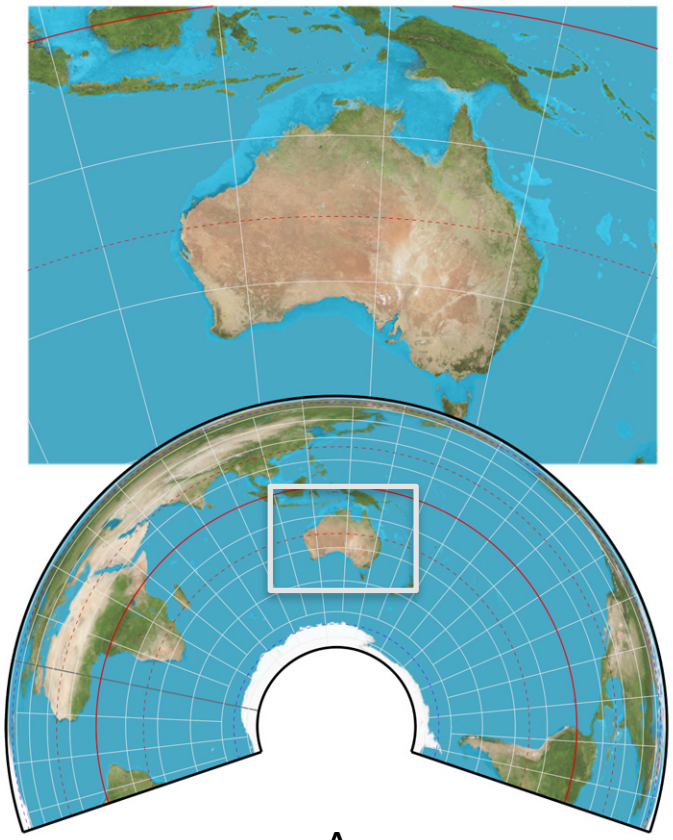

Azimuthal, Conic and Cylindrical Projections for Smaller Areas

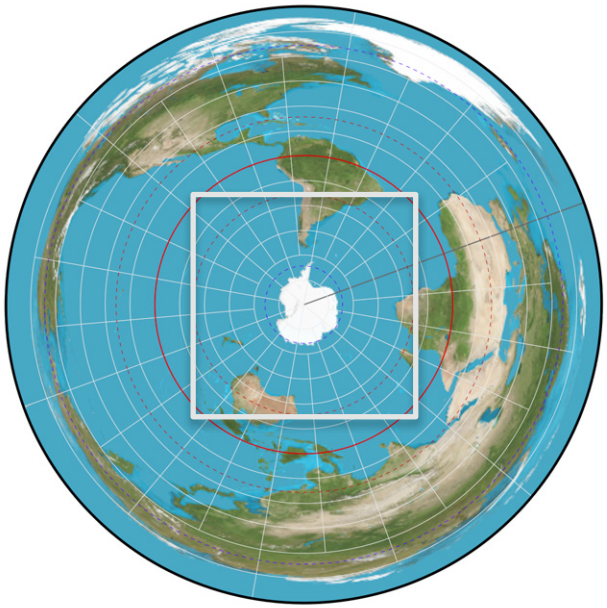

When maps use a **square format** and shows a continent or a smaller region, use an azimuthal projection.

Projection type? Distortion properties?
